

# A Perpetual Motion device

Writer: gurangax of besslerwheel.com

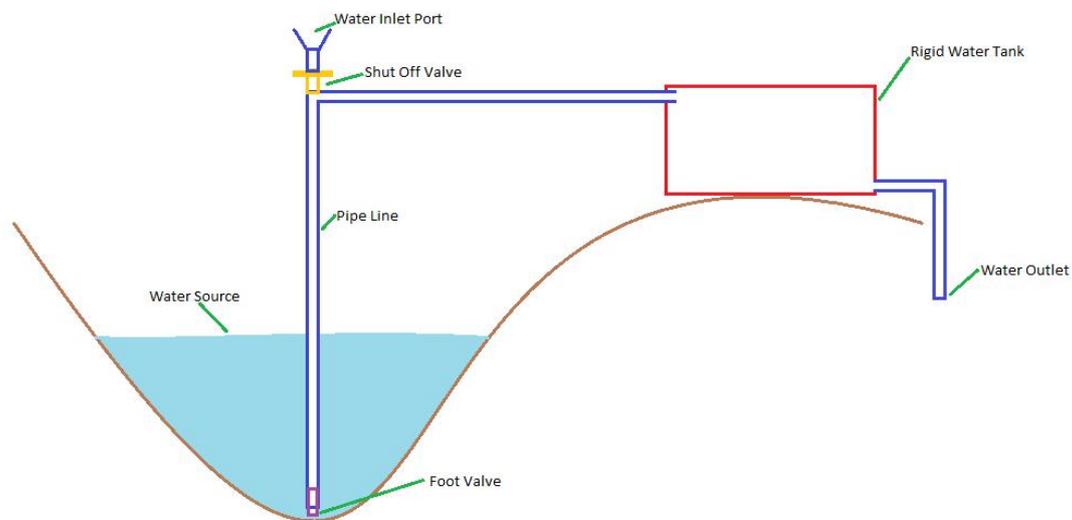

Date: 30<sup>th</sup> November 2016

This document is intended to describe how perpetual motion can be achieved when correctly done. It is also meant to confirm such device exist that can do work perpetually, as long as gravity exist. With that been said, hopefully a new era of thinking might emerge from this for the benefits of all.

---

## How it works

A device of this type uses liquid as the medium for energy transfer. It is actually a liquid pump able to pump liquid from lower ground into higher ground. This is something that can not be achieved by normal means. There is a trick to this which allows the liquid to be pumped without external force other than gravity alone into higher grounds. The liquid of choice for this document sake will be plain water.

Shown in the picture above, there is a rigid water tank made from metal or concrete where it must be able to withstand implosion. Depending on total water displacement inside the tank the implosion will be great and can damage the tank if it is not able to withstand it.

Firstly, the tank must be filled up via the water inlet port. Bear in mind that as you fill up the tank, it will be filling up the pipeline going down the water source as well. When filling up the tank the water outlet should be shutoff using a valve or any suitable device. Operation of the pump is best done after the tank is full with water.

To run the pump, first you need to shut off the water inlet port using the valve. Then simply open the water outlet and let the water from the tank run down the outlet. The outlet can be higher than the water source and can be sent back to the source perpetually. After sometime the output from the outlet will be greater than before because something happened inside the tank.

### **Why it works**

The pump works because of the vacuum pressure which was created inside the water tank as the water flows outside through the water outlet. As the vacuum pressure gets stronger it was able to counter the force which was holding back the water inlet from sucking the water source into the tank. This was made possible by the foot valve which only allows the water to flow one direction. As a result the water outlet runs as if a normal tank would run, this is something comparable with the shifting of the height of the water source (originally lower ground and now to level ground). And because of this the device should be called a "Gravity Vacuum Pump" but I am not the one who first invented it so it is not for me to name the device. Just for this document sake we shall call it the GVP device.

### **Applications**

The device is a water pump, so it will be very useful for irrigation and agriculture. For some it can be used for indefinite power generation since it is able to do the job 24/7. It's up to you what you want to do with it, be creative.

### **Conclusion**

As shown in this document, a gravity vacuum water pump was presented which was able to pump water from lower grounds into higher grounds. The device itself is very simple in constructions yet have the unique capability to be used indefinitely and should be called a Perpetual Motion device also. With that being said, Perpetual Motion device does in reality exist, and needs to be found by us. GVP is gravity driven, thus gravity can be used as a free energy source, such claims of gravity driven PM devices should not be overlooked and need careful studies as they will bring tremendous benefit. I am hoping that with this will motivate some people out there to find what truth is and not be easily let down by the naysayers.
